Characteristics and areas of use

Centurion is a mid-dark green, fine leaved perennial ryegrass with good year-round growth that forms an attractive turf at cutting heights down to 12mm. The aesthetic qualities of Centurion make it ideal for any situations requiring a close-cut, high-density turf surface. It is suitable for use in lawns, golf course fairways, tees, and green surrounds, stadiums or anywhere that a high quality dark coloured perennial ryegrass is required. It is particularly suitable for use in cricket pitches.

Breeding history

Centurion perennial ryegrass was selected from surviving plants from a badly diseased trial area. Plants were selected for leaf fineness, density, tolerance to summer melting out and year round growth. Centurion contains a high level of standard endophyte that helps to protect against insect feeding.

Sowing rate and maintenance

Centurion perennial ryegrass can be sown in lawns at 30-50g/m² (300-500kg/ha). Use the higher seeding rate for faster establishment.

In new sports fields and winter over-seeded warm season grass it should be sown at 400-500kg/ha.
