Characteristics and areas of use

Fiesta 4 displays a dark green colour along with a fine leaf texture. It forms a medium to dense sward which has a very good tolerance to summer stress. Fiesta 4 can be used in a wide variety of situations where a high quality perennial ryegrass is desired; these include golf courses, parks, sports fields and home lawns.

Fiesta 4 is highly resistant to grey leaf spot. It also has very good disease resistance to all other major diseases that affect perennial ryegrass, such as *Pythium*, brown patch, leaf spot and dollar spot.

Breeding history

Fiesta 4 was first released in 2006 as part of the Pickseed breeding programme, developed at the Pickseed research station in the U.S.A.

Sowing rate and maintenance

Seeding rates for Fiesta 4 are between 30-50g/m² (300-500kg/ha). Germination can be expected within five to seven days given warm weather and optimal soil temperatures.

Fiesta 4 performs well when mown between heights of 12mm-50mm.
