

Quality. Service. Expertise.

Rebel IV Turf-Type Tall Fescue

Key Points

- Outstanding dark green colour
- Excellent density
- Dwarf growing characteristics
- Improved disease resistance
- Admirable drought tolerance

Characteristics and areas of use

Rebel IV is a very dark tall fescue turf grass that requires less irrigation frequency than Kentucky bluegrass, perennial ryegrass and fine fescues. Rebel IV is a shade tolerant variety and ideal for home lawns, parks and sod production. It exhibits outstanding wear tolerance and resists hard use on park and home lawns. Rebel IV has an early spring green-up and holds its colour late into autumn. Rebel IV has performed well under low to moderate fertility, but performs better under high fertility levels associated with the maintenance of extensively used sports fields and showcase lawns. It is recommended for use in sod farms, parks, sports fields, home lawns and golf course rough.

Breeding history

This variety was bred and developed at Rutgers University in New Brunswick, NJ, U.S.A.

Sowing rate and maintenance

The recommended sowing rates are 30-50g/m² (300-500kg/ha). Cover seed to a depth not exceeding 5mm and keep seedlings moist until well rooted. The first mowing can be expected after 30 days or when the grass blades reach a length of 50-70mm. Limited use of the area can be expected in 6 weeks. Rebel IV can tolerate a mowing height of 40mm.
